FOR IMMEDIATE MEDIA RELEASE

Introducing...Tilt'N Place Door Systems by Amweld International

Amweld International, LLC is proud to announce their newest product. The **Tilt'N Place Door System** is an all-inclusive, pre-assembled, pre-finished, complete door/frame/hardware package which arrives on the job ready for installation. The door and frame components actually "tilt into place" and easily attach to the wall, allowing installers to fully complete a finished door opening in 30 minutes or less. Our innovative design includes some adjustability in the jamb depth to help correct inconsistencies within the wall construction that are a constant hassle when it comes to the installation of door frames. This system provides factory quality while saving time and labor costs on door and frame installations.

The "Complete Opening in a Box" arrives at the building site with two main parts: (1) a door unit which includes a factory finished door, pre-hung in a finished welded steel frame, with the hardware already installed and; (2) a corresponding trim side of the door frame. The system can be ordered with a vast selection of custom and standard components to fulfill the specifications for design, safety and regulatory needs. Door, frame and hardware are pre-finished, assembled and packaged at Amweld's facility and shipped directly to the building site with all fasteners needed for the install. Installation now takes place after the walls are painted and finished, significantly reducing punch list items.

"The assembly includes the choice of any quality Amweld or Firedoor branded door and Tilt'N Place frame...pre-hung, pre-finished and factory-installed with the customer's preference of hardware," stated Dan Perry, Tilt'N Place Product Manager at Amweld International, LLC. "Security, acoustical, stile & rail, decorative, high-traffic commercial or wood finished door options are available to meet the customer's specifications. All components of the assembly are tested and adjusted before leaving the factory."

The product answers the call as a quality solution for projects with a high number of repeatable openings, a shortage of affordable or qualified labor, and projects with tight deadlines requiring quick installation. Tilt'N Place can also provide up to a 90 minute fire rated opening when specified.

“This product is engineered to fit any wall thickness and dramatically reduces material handling requirements,” stated Mike Kolovich, Vice President of Engineering at Amweld International, LLC. “The frames have welded, mitered corners and the pre-assembly reduces project impacts and delays, the need for highly skilled labor, and saves on project management coordination. When architects specify Tilt’N Place, they provide a cost effective solution for their clients. When estimators propose Tilt’N Place, they enable their team to win more projects that have time-sensitive deadlines and the cost savings allows their project bids to reach the final selection round.”

“Tilt’N Place Door Systems will fill a big void,” stated Chuck Gerber, Vice President of Sales & Marketing at Amweld International. “Amweld has recognized the need in the industry for faster and more cost-effective quality door opening installation solutions. Our first substantial order for this new product was recently closed at a large military base, where both cost savings and timely installation were selection requirements.” The availability to order customized products provides a multitude of solutions. The Tilt’N Place Door System is ideal for office buildings, hotels, and condominiums and is suitable for use in commercial, residential and industrial building applications.

This new product will also be available in a stock SKU offering, as well as for customized job orders. The stock offerings will fill the need for the most common over-the-counter sales at distributors and dealers, supplying projects involving quick repair, temporary wall and drywall partition tenant fit-up installations.

Tilt’N Place Door Systems by Amweld International will be branded with the following mark on packaging and literature:
